

- Screen's are obsolete
- AR is the future
- Imagine standing in a line waiting to buy lunch while still being able to work

# HyperGlass

- A computer without a screen
- A wearable AR glass from which the hardware is separated – light & thin
- Paired with computers/smartphones (could partner up with Microsoft's Windows and Google's Android by developing a driver that integrates the glass's visual display into the operating system) wirelessly
- Comes with a swipe track pad
- Cool, fashionable, and fancy design
